Portfolio: <https://george0-00.github.io/Portfolio/>

SUMMARY

Junior Python Backend Developer with a proven ability to build secure, test-covered REST APIs on Python 3 and Django. Comfortable owning end-to-end backend tasks: JWT auth, service-layer business logic, PostgreSQL, and third-party HTTP integrations. Focused on clean, maintainable code and ready to contribute to a collaborative engineering team.

TECHNOLOGIES

- Languages & fundamentals: Python 3, OOP, JSON, HTTP, Linux (CLI)
- Backend: Django, Django REST Framework, REST API / RESTful API, API Development, JWT (SimpleJWT), Authentication, Authorization, Class-Based Views (CBV), MVC / MTV, service layer / layered architecture
- Databases: PostgreSQL, SQLite, SQL, Django ORM, CRUD, query optimization (select_related, annotate)
- Testing & code quality: pytest, unittest, Unit Testing, flake8, PEP8
- Tools: Git, GitHub, Version Control, requests, venv, pip, requirements.txt, environment variables

PROJECTS

Crypto Portfolio Tracker

<https://github.com/George0-00/crypto-portfolio-tracker> · Python 3, Django, DRF, SimpleJWT, PostgreSQL, unittest, requests

Backend REST API for crypto transaction tracking and live portfolio valuation (PnL / ROI).

- Built a secured RESTful API with JWT authentication (access/refresh) and user registration, enabling safe transaction management for a personal portfolio tool.
- Moved portfolio analytics (amount, invested, current_value, PnL, ROI) into a dedicated service layer so authenticated users get clear valuation metrics from a single endpoint.
- Integrated CoinGecko as a third-party pricing API for real-time market prices, with provider error handling and graceful degradation so the API stays available when prices fail.
- Configured PostgreSQL via environment variables and covered core API flows with automated tests (unittest / Django test runner).

Blogicum

<https://github.com/George0-00/blogicum> · Python 3, Django, SQLite, pytest, flake8

Django web backend for publishing: posts, comments, profiles, authentication and authorization.

- Delivered a full publishing flow with Class-Based Views (CRUD): posts with categories and drafts, comments, and profiles, with authorship checks that restrict unauthorized edits.
- Set up registration, password change and reset; enforced authorization rules so only owners can modify their content.
- Eliminated N+1 queries with select_related and annotate on feeds and profiles; added pagination for author publications to keep list views efficient.
- Covered business logic with pytest unit tests and maintained PEP8 style with flake8.

EDUCATION

Secondary vocational education — Information Systems Programming (diploma)

Yandex Praktikum — Python Developer (intensive backend / software development retraining program)

ADDITIONAL

- Languages: Russian (native), English (working)
- Strong debugging and problem-solving skills — demonstrated through external API error handling and resilient portfolio endpoints
- Open to junior / internship roles (remote); pet projects on GitHub
- Actively building hands-on skills in FastAPI and Docker
